

AI SAAS BUILDER CHALLENGE

THE CHALLENGE

Identify an **underserved problem** faced by **student creators** and turn it into a simple **Micro SaaS solution** that people would want to try.

1. A student creator could be someone making reels, YouTube videos, newsletters, memes, educational content, design content, campus content, or personal brand content while still studying.
2. Your job is to find a repeated, boring, painful problem in their creator journey - and build a software idea around it.
3. Your Micro SaaS solution should ideally have a **freemium model**, where users can try the product for free and upgrade when they need more features, storage, automation, templates, analytics, or usage limits.
4. Your goal is simple:
5. **Find a creator problem small enough to solve clearly, but painful enough that someone may eventually pay for it every month.**

You will build:

1. A clear problem statement
2. A Micro SaaS solution idea
3. A target user/persona
4. A freemium pricing model
5. A user flow showing how the product works
6. Screen mockups of the core product experience
7. A deck explaining your idea, strategy, and product logic

For additional brownie points, you may also build:

1. A landing page for your SaaS idea
2. A working MVP concept using tools such as Lovable, Bolt, Cursor, Framer, Figma, or any AI tool you see fit

PRODUCT ELIGIBILITY

To be eligible for submission, your Micro SaaS idea must meet the following conditions:

1. It must solve a problem faced by student creators.

2. It must focus on a specific underserved problem, not a generic “all-in-one creator platform.”
3. It must include a clear target user and use case.
4. It must include a freemium or subscription-based pricing model.
5. It must include a user flow explaining how someone would use the product.
6. It must include screen mockups for the main product experience.
7. It must be simple enough to realistically become a Micro SaaS product.

The Question You Are Trying to Answer

What boring, repeated problem faced by student creators can I turn into software that people would actually try for free and eventually pay for every month?

FINAL SUBMISSION

Submit the following:

1. **Presentation/deck** explaining your problem statement, solution, target user, pricing model, user flow, and product strategy, including **Screen mockups** showing the core product experience
2. **Bonus:** Landing page, clickable prototype, or working MVP concept built using tools such as Lovable, Bolt, Cursor, Framer, Figma, or any AI tool you see fit
3. Date of Submission: **23rd June 2026**
